Background

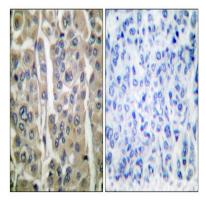

Catalog #: APRab12691

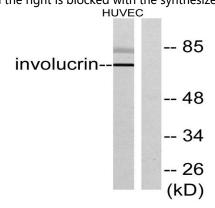

involucrin(IVL) Homo sapiens Involucrin, a component of the keratinocyte crosslinked envelope, is found in the cytoplasm and crosslinked to membrane proteins by transglutaminase. This gene is mapped to 1g21, among calpactin I light chain, trichohyalin, profillaggrin, loricrin, and calcyclin. [provided by RefSeg, Jul 2008], function: Part of the insoluble cornified cell envelope (CE) of stratified squamous epithelia., PTM: Substrate of transglutaminase. Some glutamines and lysines are crosslinked to other involucrin molecules, to other proteins such as keratin, desmoplakin, periplakin and envoplakin, and to lipids like omega-hydroxyceramide.,similarity:Belongs to the involucrin family.,subcellular location:Constituent of the scaffolding of the cornified envelope., subunit: Directly or indirectly cross-linked to cornifelin (CNFN)., tissue specificity:Keratinocytes of epidermis and other stratified squamous epithelia.,
