Background

NEIL3 belongs to a class of DNA glycosylases homologous to the bacterial Fpg/Nei family. These glycosylases initiate the first step in base excision repair by cleaving bases damaged by reactive oxygen species and introducing a DNA strand break via the associated lyase reaction (Bandaru et al., 2002 [PubMed 12509226]).[supplied by OMIM, Mar 2008], function: Reports about DNA glycosylase activity are contradictory. The protein lacks a proline residue at the Nterminus that is the active site residue found in the other members of the FPG family., similarity: Belongs to the FPG family., similarity: Contains 1 FPG-type zinc finger., similarity: Contains 1 RanBP2-type zinc finger., tissue specificity: Detected in thymus and testis.,
