Background

The protein encoded by this gene is membrane-associated and contains five ankyrin repeats, a protein phosphatase-1-interacting domain, and a carboxy-terminal CAAX box domain. Synthesis of the encoded protein is inhibited by transforming growth factor beta-1. The protein may bind to the membrane through its CAAX box domain and may act as a signaling molecule through interaction with protein phosphatase-1. Alternative splicing results in multiple transcript variants encoding different isoforms that may undergo similar processing to generate mature protein. [provided by RefSeq, Sep 2015], function: May be a downstream target for TGF-beta1 signaling cascade in endothelial cells., induction: Inhibited by TGF-beta1., similarity: Contains 5 ANK repeats., subunit: Binds PP1., tissue specificity: Highly expressed in vascular endothelium, CNS, lung, spleen, kidney and testis.,
