## Background

The PDH complex is composed of multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3). Catalyzes the removal of CO<sub>2</sub> from pyruvate. Mutations in the  $\alpha$  subunits of pyruvate dehydrogenase (E1) lead to congenital defects that are usually associated with lactic acidosis, neurodegeneration and early death.

## Research Area

Signal Transduction

## Image Data

Western blot analysis of pyruvate dehydrogenase (lipoamide) alpha 1 in COS7, Jurkat, C6, 3T3 and Hela lysates using pyruvate dehydrogenase (lipoamide) alpha 1 antibody.
