Background

The PDH complex is composed of multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3). Catalyzes the removal of CO₂ from pyruvate. Mutations in the α subunits of pyruvate dehydrogenase (E1) lead to congenital defects that are usually associated with lactic acidosis, neurodegeneration and early death.

Research Area

Signal Transduction

Image Data

Western blot analysis of pyruvate dehydrogenase (lipoamide) alpha 1 in COS7, Jurkat, C6, 3T3 and HeLa lysates using pyruvate dehydrogenase (lipoamide) alpha 1 antibody.
