Background

This gene encodes glucocorticoid receptor, which can function both as a transcription factor that binds to glucocorticoid

response elements in the promoters of glucocorticoid responsive genes to activate their transcription, and as a regulator of other transcription factors. This receptor is typically found in the cytoplasm, but upon ligand binding, is transported into the nucleus. It is involved in inflammatory responses, cellular proliferation, and differentiation in target tissues. Mutations in this gene are associated with generalized glucocorticoid resistance.

Research Area

Neuroactive ligand-receptor interaction;
