Background

This gene encodes a transcriptional repressor that interacts with several members of the BCL2 family of proteins.

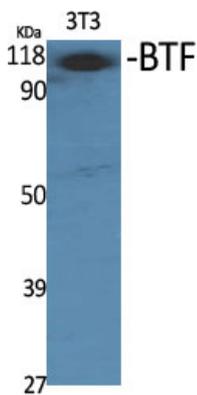

Overexpression of this protein induces apoptosis, which can be suppressed by co-expression of BCL2 proteins. The protein localizes to dot-like structures throughout the nucleus, and redistributes to a zone near the nuclear envelope in cells undergoing apoptosis. Multiple transcript variants encoding different isoforms have been found for this gene. Potential poly-A sequence.,subunit:Interacts with Bcl-2 related proteins, EMD, with the adenovirus E1B 19 kDa protein and with DNA.,tissue specificity:Ubiquitous.,
