Background

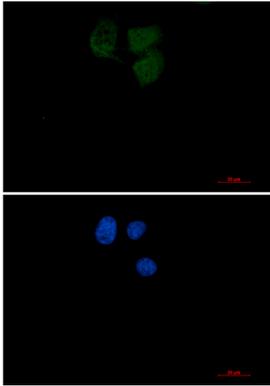

The UBE2V1-UBE2N and UBE2V2-UBE2N heterodimers catalyze the synthesis of non-canonical 'Lys-63'-linked polyubiquitin chains. This type of polyubiquitination does not lead to protein degradation by the proteasome. Mediates transcriptional

activation of target genes. Plays a role in the control of progress through the cell cycle and differentiation.

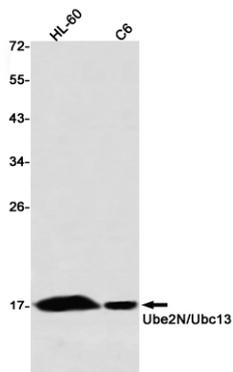

Research Area

Epigenetics and Nuclear Signaling
